Bioness Medical Announces Commercial Launch of HaloPlex™

HaloPlex redefines Body Weight Support for Real-World Movement.

VALENCIA, Calif., September 21, 2026 – Bioness Medical, Inc. ("Bioness"), a leading provider of advanced rehabilitation technologies, today announced the commercial launch of **HaloPlex™**, an FDA-registered dynamic body weight support and fall protection system designed to accelerate physical rehabilitation for patients with severe gait and balance impairments.

HaloPlex extends the proven **Vector Gait & Safety System®** by combining dynamic body weight support, overhead fall protection, and multidirectional movement capabilities in a ceiling-mounted system. The technology unloads a programmed amount of patient body weight while providing continuous postural support, enabling patients to practice walking, balance activities, transfers, and functional mobility tasks more safely and with greater confidence throughout the therapy environment.

Designed for inpatient rehabilitation hospitals, outpatient clinics, and rehabilitation centers, HaloPlex helps clinicians deliver earlier, higher-intensity mobility training while reducing the physical demands associated with gait rehabilitation. By allowing patients to move freely through a larger therapy space, the system supports more natural movement patterns and increased opportunities for task-specific rehabilitation.

*"HaloPlex represents the next evolution of our body weight support technology portfolio," said **Todd Cushman, Chief Executive Officer of Bioness Medical.** "Built on the trusted Vector platform, HaloPlex expands what's possible in gait and balance rehabilitation by allowing patients to safely practice real-world mobility activities with multidirectional movement and overhead fall protection. As healthcare organizations continue investing in rehabilitation programs, they need more than innovative technology. They need a trusted partner that delivers clinical expertise, education, implementation support, and long-term program success."*

The commercial launch of HaloPlex further strengthens the Bioness rehabilitation portfolio, which includes Vector, BITS® and BITS Functional Reality™, AURA™ (in development), PoNS®, L300 Go®, and H200 Wireless™ technologies. Together, these solutions help providers advance patient recovery, improve functional outcomes, and build comprehensive

rehabilitation programs supported by Bioness' nationwide team of trained rehabilitation professionals. For additional information, please visit BionessMedical.com/haloplex.

About Bioness Medical

Bioness Medical is a leading provider of advanced rehabilitation technologies designed to restore mobility, function, and independence. Its portfolio spans functional electrical stimulation, body weight support systems, robotic gait training, neuromodulation, and interactive rehabilitation technologies that support clinicians and healthcare systems worldwide.
